

PHOTOVOLTAIC INSTALLATIONS

- For a free standing or roof mounted system use a Zoning Permit Application form.
- Include a site plan showing the size and location of the installation. Free standing systems are to conform to the requirements for accessory structures: meet the principal building setbacks of the zoning district and be no taller than 20 feet.
- A site plan can be hand drawn or use a “Google Earth” or other aerial print of the property.
- An Engineer or Architect is to supply a signed report indicating that an existing roof is adequate to support the extra load of a roof mounted system, or provide detail drawings of how the roof is to be modified to take the extra load.
- If roof modifications are to be made, a Building Permit Application is required with two signed and sealed copies of the construction details.
- All applications will require an Electrical Permit Application and two copies of installation wiring diagrams reviewed and approved by a Third Party Electrical Plan Review Agency. (See Forms for Download on the Twp. website or the PA Dept. of Labor & Industry website for a list of Third Party Agencies).
- A copy of the utility (PECO) Interconnection Approval is to be submitted with the permit application. (The final inspection of the installation will not be approved until the utility company’s Permission to Operate is received by the Code Office).
